The closest reference No. 5,125,268 does not disclose or suggest the improvement of the instant application comprises measuring mechanical impulses of hydrometeors falling on a detection surface and corresponding threshold values; defining a first/second parameter of the impulse in a first/second time window; comparing the first and second time-window parameters in order to eliminate a spurious signal by creating a ratio between the first and second time windows as a limit value for the spurious signal as in claims 1, 6, 8, and 10 or a triggering initiation of the measuring step in connection with one of the impulses exceeding the threshold value and adjusting the triggering level of the hydrometeor signal detection circuit on the basis of wind
